## **PART I**

### **BACKGROUND**

The text in this section is adapted (with changes as needed) from: *Speech and motor speech assessment findings in eight complex neurodevelopmental disorders*. (Technical Report No. 24). Phonology Project, Waisman Center, University of Wisconsin-Madison.

#### **The Phonology Project**

The Phonology Project is a research program in Speech Sound Disorders (SSD) of known and unknown origin. The primary goal of the Phonology Project is to identify risk factors and develop diagnostic measures and behavioral (speech-prosody-voice) classification markers for five types of speech disorders and four types of motor speech disorders. Each of the nine speech and motor speech disorders can occur in idiopathic contexts or in the context of complex neurodevelopmental disorders. The research plan for the Phonology Project is a four-level framework termed the Speech Disorders Classification System (SDCS). All data reduction and analyses of SDCS measures and analytics are completed in a software environment termed PEPPER: Programs to Examine Phonetic and Phonologic Evaluation Records (PEPPER, 2018). PEPPER is scheduled to be made freely available for download in 2018.

#### **Phonology Project Technical Reports**

Phonology Project Technical Reports provide technical information and reference data on measures and analyses available in the PEPPER software suite that were used in research presentations, publications, and in other technical reports. The present technical report provides speech and motor speech information on 28 children with Childhood Apraxia of Speech (CAS). Shriberg et al. (2017; see Table 3 and associated discussion) describes the rationale for constituting a group of children, termed the Consensus CAS Group, classified as positive for

CAS using both the Pause Marker criteria and Mayo Clinic criteria. The motivation for the report is to provide additional information on a group of children with CAS, with and without concurrent Childhood Dysarthria at assessment, who did and did not meet criteria for Speech Motor Delay (see Table 1). Information in the current technical report, including the individual participant information in the present Table 1, provides reference data for a number of issues and questions discussed in associated research on childhood motor speech disorders.

As is customary in this laboratory series, the information in this report is presented without interpretive analyses or comment. Constraints on the internal and external validity of information include the possibility of sampling errors due to limitations in the number and diversity of participants, and potential limitations in the research design and statistical methods. We invite questions and correspondence on any aspect of the information in this report that may be helpful to researchers, instructors, and clinicians.

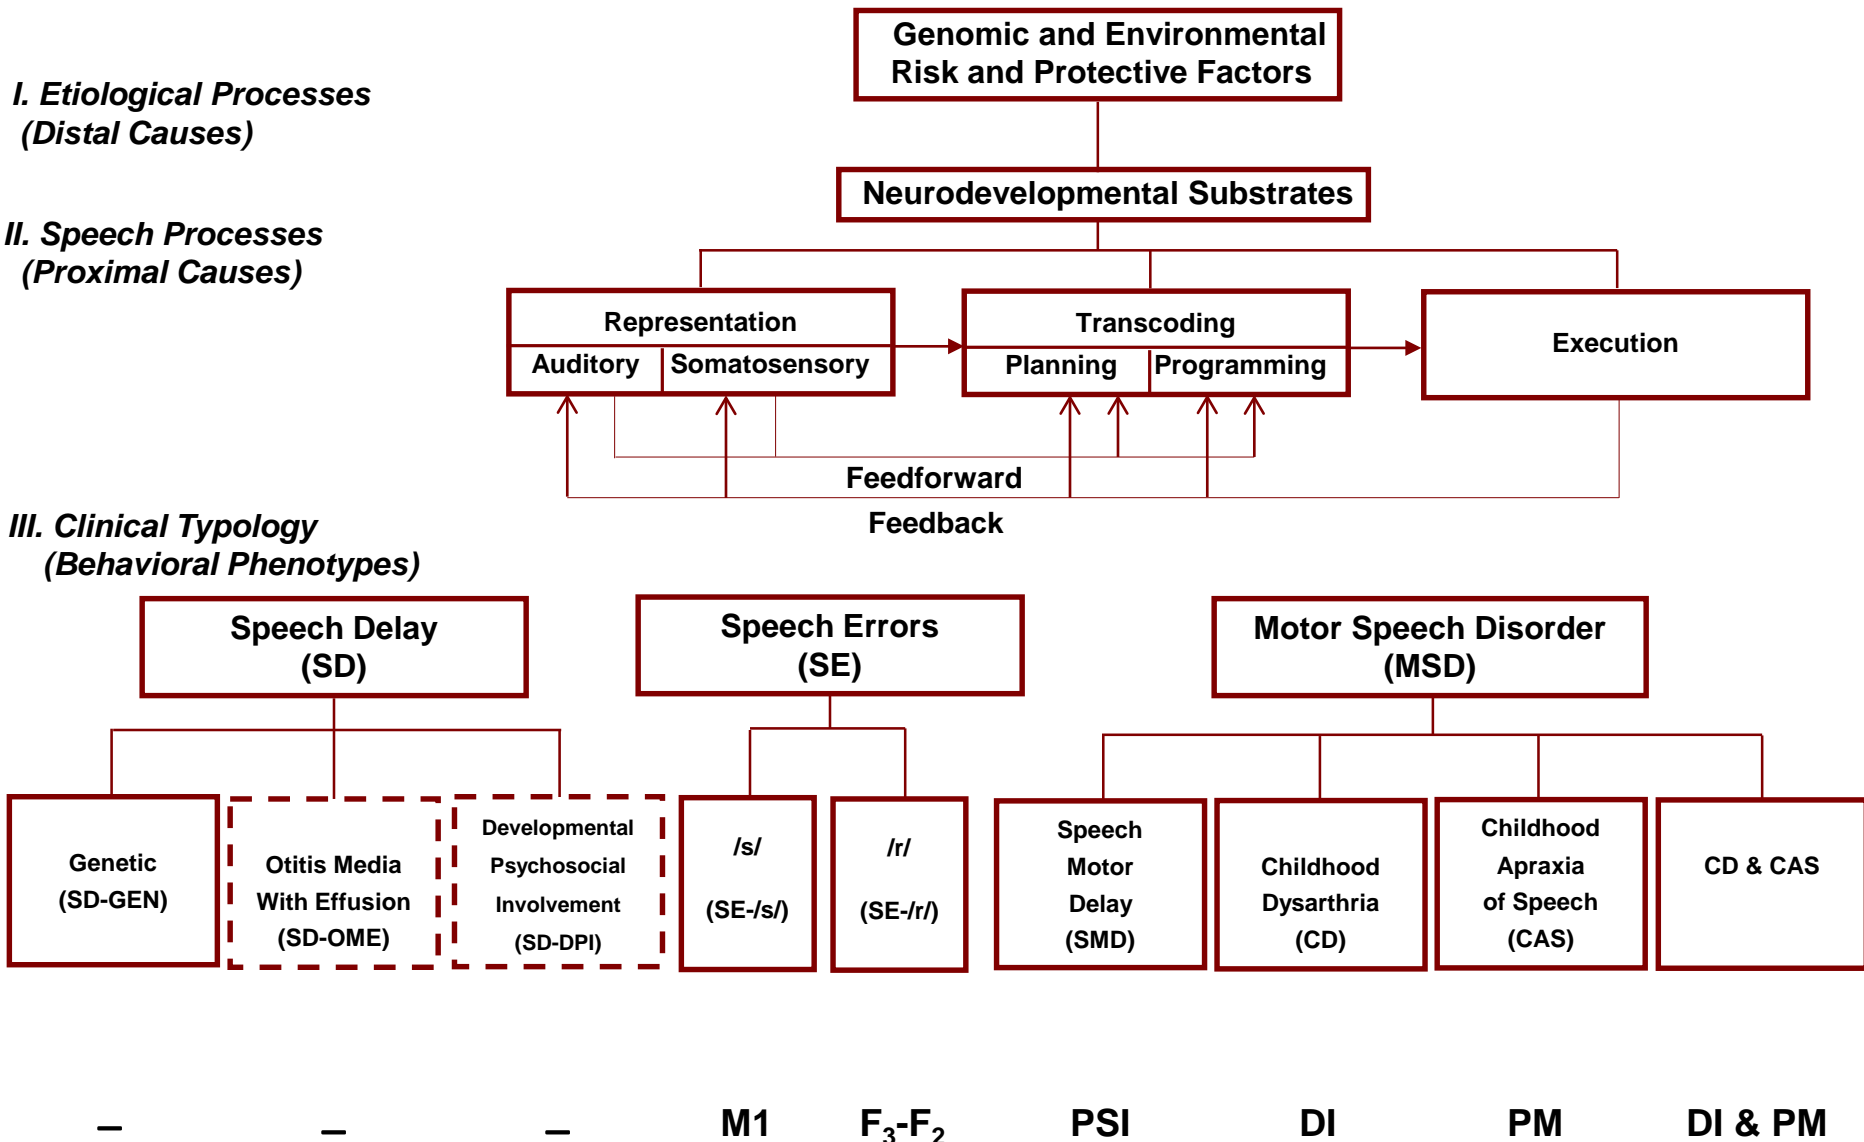

### **The Speech Disorders Classification System (SDCS)**

Figure 1 is a graphic description of the finalized version of the SDCS (Shriberg, Strand, & Mabie, 2018). In addition to preliminary versions of the SDCS in the 1980s, papers that include revisions and extensions of the SDCS and citations to other developmental SDCS research include Shriberg (1993, 1994, 2010, 2017); Shriberg, Austin, Lewis, McSweeney, and Wilson (1997); Shriberg et al. (2010); and Shriberg, Strand, and Mabie (2018). A number of Phonology Project technical reports include descriptions of methods and measures using the SDCS framework, and additional tabular and graphic reference data and findings. The following brief description of the SDCS in Figure 1 focuses only on terms and concepts relevant for the present technical report.

# I. Etiological Processes (Distal Causes)

# II. Speech Processes (Proximal Causes)

# III. Clinical Typology (Behavioral Phenotypes)

<sup>a</sup> M1: First Spectral Moment; F<sub>3</sub>/F<sub>2</sub>: Format 3/Formant 2; PSI: Precision-Stability Index; DI/DSI: Dysarthria Index/Dysarthria Subtype Indices; PM: Pause Marker

Level III within Figure 1, termed Clinical Typology, depicts the three classes of SSD, including the nine types of speech and motor speech disorders that may or may not be comorbid in a given speaker historically or at a given point in time. The first class of SSD, Speech Delay (SD), posits three risk factors for early and possibly persistent SD —genetic risks, early fluctuant conductive hearing loss, and psychosocial risk factors. The solid line around genetic risks indicates that research progress in speech genetics and other verbal trait disorders since the 1980's supports genomic risk factors for SSD. As indicated by the dashes for SD-GEN in Figure 1, Level IV, however, Phonology Project research has not developed diagnostic markers with sufficient sensitivity and specificity to identify children with SD-GEN (see Table 1-4 in Shriberg [2010] for promising speech-prosody-voice markers of SD-GEN to that date). The dashed borders for the other two risk factors at Level II indicate that although research findings in otitis media with effusion and developmental psychosocial involvement since the 1980s have provided statistical support for their association with early and persistent SD, research has not yielded sufficient, cross-validated support for SD-OME and SD-DPI as subtypes of SD.

The second class of SSD shown in Figure 1, Speech Errors (SE), includes two subtypes associated with phonetically challenging manner classes in languages of the world: a subtype limited to distortions of sibilants (SE-/s/) and a subtype limited to distortions of rhotic vowels and rhotic consonants (SE-/r/).

The third class of SSD, Motor Speech Disorders (MSD), includes the four remaining subtypes of SSD proposed in recent research using the finalized version of the SDCS referenced previously: Speech Motor Delay (SMD), Childhood Dysarthria (CD), and Childhood Apraxia of Speech (CAS).

## **Reference Databases, Standardization Criteria, and SDCS Classification Procedures**

Phonology Project Technical Report 23 (Mabie & Shriberg, 2017) includes information on the reference databases, standardization criteria, and SDCS classification procedures used to obtain scores on the measures of speech and motor speech disorders described in Table 1 of Technical Report 23. Additional information on the 200 typically-speaking participants assessed on a two-hour speech-assessment protocol is described in Potter et al. (2012) and Scheer-Cohen et al. (2013). The latter two Phonology Project Technical Reports include information on the sociodemographic composition of the sample and methods for speech sampling and data reduction using narrow phonetic transcription, prosody-voice coding, and acoustic analyses. They also include descriptive statistics for each age x sex group from 3-80 years of age.

Phonology Project Technical Report 24 (Shriberg & Mabie, 2017) includes speech and motor speech information on 362 participants with eight types of complex neurodevelopmental disorders. The information in Part II of the present technical report uses the same format as the format in Technical Report 24 to present findings for ten measures and summaries of speech and motor speech data.

## **Description of 28 Participants with Childhood Apraxia of Speech (CAS)**

As indicated previously, Table 1 of the present report includes brief descriptions of 28 children with CAS, including information on age, sex, cognition, language, and speech. As indicated previously, some of the information in Table 1 was added for research in childhood motor speech disorders described in Shriberg, Strand, and Mabie (2018) and Shriberg, Campbell, Mabie, and McGlothlin (2018).

Table 1. Consensus CAS participants. Shriberg et al. (2017) includes rationale for and additional information on participants. Research since that publication motivated inclusion of individual participant data on CAS status (idiopathic, neurogenetic), Speech Motor Delay status, and for Ordinal Intelligibility Index classification.

## **Abbreviations**

### **Units and Symbols**

The following abbreviations for measurement units and characters are used in the sample measures and summaries and reference data in Parts II and III.

dB	decibel
ms	milliseconds
<i>n</i>	count
%	percentage
*	no data

### **Measures and Classifications**

CAS	Childhood Apraxia of Speech
CD	Childhood Dysarthria
CD & CAS	Childhood Dysarthria and Childhood Dysarthria of Speech
CMS	Competence Measures Summary
CND	Complex Neurodevelopmental Disorders
DI	Dysarthria Index
DSI	Dysarthria Subtypes Indices
II	Intelligibility Index
ISSD	Idiopathic Speech Sound Disorders
MSD	Motor Speech Disorder
No MSD	No Motor Speech Disorder
NSA	Normal(ized) Speech Acquisition
OII	Ordinal Intelligibility Index

PCC	Percentage Consonants Correct
PM	Pause Marker
PMI	Pause Marker Index
PMS	Pause Marker Summary
PSD	Persistent Speech Delay
PSE	Persistent Speech Errors
PSI	Precision-Stability Index
PVSP	Prosody-Voice Screening Profile
SCI	Speech Competence Index
SD	Speech Delay
SD-DPI	Speech Delay-Developmental Psychosocial Disorder
SD-GEN	Speech Delay-Genetic
SD-OME	Speech Delay-Otitis Media with Effusion
SDCS	Speech Disorders Classification System
SDCSS	Speech Disorders Classification System Summary
SE	Speech Errors
SMD	Speech Motor Delay
SRT	Syllable Repetition Task
SSD	Speech Sound Disorders

## **PART II**

### **TEN SDCS SPEECH AND MOTOR SPEECH OUTPUTS**

#### **A. Speech and Motor Speech and Motor Speech Outputs for 28 Participants with CAS or CD & CAS**

The following outline describes the format of the ten speech and motor speech outputs described in Mabie and Shriberg (2017) and Shriberg and Mabie (2017). Note that for two of the speech measures, detailed outputs are not available; summative findings are available in the Competence Measures Summary (CMS).

##### **Speech Measures and Summaries**

**Percentage Consonants Correct (PCC)**

**Intelligibility Index (II) and Ordinal Intelligibility Index (OII)**

**The II and OII findings are in the Competence Measures Summary**

**Prosody-Voice Screening Profile (PVSP)**

**Speech Competence Index (SCI)**

**Syllable Repetition Task (SRT)**

**The SRT findings are in the Competence Measures Summary**

**Competence Measures Summary (CMS)**

##### **Motor Speech Measures and Summaries**

**Speech Motor Delay (SMD) Measure:**

**The Precision-Stability Index (PSI)**

**Childhood Dysarthria (CD) Measure:**
